                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Southern blot analysis was performed using a bovine cDNA probe contg.

a fragment of a PI3-kinase-encoding sequence and human cDNA isolated
c from a cDNA library constructed from mRNA isolated from the human
cell line KGla. Positive clones were sequenced to give the human
cell line KGla. Positive clones were sequenced to give the human
with the bovine sequence. The domain contg. residues 19-100 of human
pl10 is sufficient to associate with the p85 kinase subunit. The
protein with PI3 kinase activity is useful for screening for
c ant)agonists of PI3 kinase activity which could be useful for
stimulation or inhibition of cell proliferation and hence
c prophylaxis or therapy. Platelet or neutrophil activity or blood
c glucose levels can be controlled using the kinase.

                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                        The present invention relates to identifying a modulator of the phosphatidylinositol 3-kinase (PISK, pilodelta) anotyme that binds to the ortalytic subunit via a SH3 domain-containing polypeptide such as LASP-1. Also described are methods of assaying the specific binding affinity of the PI3-kinase binding partner. Such modulators are useful for the treatment of diseases characterised by the undesirable or excessive activity of PI3Kdelta. For example the modulators are useful for inhibiting the growth or proliferation of cancer cells (e.g. malignant neoplasms of lymphoid and reliculoendothelial tissues, Hodgkin's lymphoma, leukaemias), inflammatory diseases (e.g. rheumatoid arthitis), ophthalmic disorders (e.g. alloging erythematosus), inflammatory dermatical diseases (e.g. chronic inflammatory bowel disease), inflammatory dermaticses (e.g. context dermatitis; central or peripheral nervous system inflammatory disorders (e.g. meningitis), bacterial pneumonia, and Type I diabbetes mellitus. The present sequence represents human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    40;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      245

                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel antisense compound (I) 8-30 nucleobases in length targeted to a start codon or nucleobases 4-3174 of the coding region of human P13 kinsase pl10bera (II), in which (I) specifically hybridizes with and inhibits the expression of (II). The products of the invention have cytostatic, antiinfilammatory and antiinfective activity. (I) is useful for inhibiting the expression of (II) in human cells or tissues. The antisense compound can be utilized for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The antisense compounds may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. The antisense compounds are useful for research and diagnostics, because these compounds hybridize to nucleic acids encoding (II).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              354

PT Identifying a gene involved in disease for treating hypoxia-regulated conditions, comprises comparing the transcriptome/proteome of two cell rypes under different conditions and identifying a differentially xx by regulated gene - conditions and identifying a differentially captains that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/proteceme of a specialised cell type implicated in a disease or condition, with that of a condition. The method comprises comparing the transcriptome/proteceme of specialised cell type, under two experimental conditions, and comparined appearance of a feel type, under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABV77873-ABV78116 cand ABR65061-ABR65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourisenesis, angiogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated condition, such as cancer, ischaenic conditions, reperfusion injury, condition, such as cancer, ischaenic conditions, reperfusion injury, retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropolesis or hair loss.

Application US/09974573
Publication No US20030022344A1
GENERAL INFORMATION:
APPLICANT: Williams, Roger
APPLICANT: Ried, Christian
APPLICANT: Ried, Christian
APPLICANT: Stephens, Len
TITLE OF INVENTION: PHOSPHOINOSITIDE 3-KINASES
CURRENT APPLICATION: PHOSPHOINOSITIDE 3-KINASES
CURRENT APPLICATION NUMBER: US/09/974,573
CURRENT PILING DATE: 2000-10-23
PRIOR APPLICATION NUMBER: US 60/242,801
PRIOR APPLICATION NUMBER: US 60/242,801
PRIOR FILING DATE: 2000-10-23
NUMBER OF SEQ ID NOS: 1
SEQ ID NO: 1
LENGTH: 1102
HADDOLLEMENT PLING
        ; ORGANISM: Porcine PI3K
